Zamp vendor onboarding walkthrough

Human voiceover script | Rafad Abdul Rasheed | 4:57 demo

Recording note: Timecodes and scene titles are visual cues. Speak only the paragraph under each heading, at a natural pace.

00:00-00:32 Introduction and demo profiles

Hi, I'm Rafad Abdul Rasheed. When a company brings on a supplier, someone has to bring together the application, supporting documents and follow-up questions. A missing detail can delay a good supplier; a missed mismatch can create risk. Zamp keeps the information, checks and next steps together, so suppliers know what to do and reviewers can see why a case needs attention. The profiles here are fictional. Zoya works in procurement at another buyer company; her cases stay separate from Apex's.

00:32-00:38 Choose the supplier demo profile

I'll start as Vikram, using the supplier profile linked to his company, Apex Components.

00:38-00:51 Supplier business identity

First, I confirm the business name, type and address. This application belongs to Apex Components, so its documents and decisions stay with the right supplier.

00:51-01:03 Supplier tax registration

Next are the tax details. Zamp checks the format here, then compares entered values with what it reads from supporting documents. Registry responses in this demo are simulated.

01:03-01:10 Supplier authorised contact

Here, the buyer gets a named person for questions and follow-up.

01:10-01:18 Supplier banking details

Bank details can be checked against the uploaded proof. Sensitive account numbers are masked in staff views.

01:18-01:25 Supplier business classification

Business activity helps the buyer decide which documents this supplier needs to provide.

01:25-01:35 Supplier document checklist

The checklist reflects this supplier's business type. Vikram can preview each file and see what Zamp read before submitting.

01:35-01:53 OCR review and applicant correction

OCR, or text recognition, is how Zamp reads a document. Here it misread a character on the PAN card. Vikram checks the preview, corrects the value himself and explains why. Both versions stay on record, and checks run again. A reviewer still decides.

01:53-02:00 Supplier reviews and declares

Before sending the application, Vikram reviews it and makes the required declarations.

02:00-02:13 Live submission and check result

Once submitted, Zamp runs the checks and gives the supplier a reference and status. Those checks highlight what needs attention; they don't approve the application.

02:13-02:26 Procurement assigns the reviewer

Now I switch to Pooja's procurement profile. She assigns the submitted case to Rajesh, so one reviewer owns the next step and the handoff is recorded.

02:26-02:43 Reviewer examines the evidence

Rajesh signs in to his assigned queue. He opens the application and checks the documents alongside the validation findings. This brings the evidence together for his review.

02:43-02:52 Reviewer records the decision

After reviewing the evidence and confirming it supports approval, Rajesh records his decision. A person makes the final call.

02:52-03:04 Supplier receives the decision

Vikram signs back in and sees the approval notice. It confirms onboarding is complete and tells him there are no more tasks for this application.

03:04-03:26 Live GSTIN and PAN conflict

Now a different supplier submits a separate case. Zamp compares the PAN entered on the application with the PAN encoded in the GSTIN. Characters three through twelve of a GSTIN are the PAN. These values don't match, so approval is held and the supplier is asked to check the right entity's details. This is synthetic data.

03:26-03:48 Supplier corrects the GSTIN

The supplier checks the GST certificate, enters the corrected GSTIN and explains the change. The response stays with the original clarification for Rajesh to review. Sending a reply moves the case forward; it doesn't approve it.

03:48-04:03 Reviewer sees the supplier's reply

Rajesh sees the supplier's response on the case and can review the change against the evidence. He still decides whether the issue is resolved.

04:03-04:17 Conflict run remains traceable

Here, we can reopen the check and see why approval was held. That gives the team a clear reason to refer to during review.

04:17-04:26 Registry timeout means unknown

A simulated registry times out. That's unknown, not a supplier failure. Staff can retry without asking the supplier to resubmit.

04:26-04:57 Thank you and close

Across this flow, suppliers can see what to provide and what needs attention. Procurement can assign ownership, and reviewers can see the evidence behind a decision. Zamp flags conflicts and routes questions to the right person. The documents and registry responses here are synthetic. In a pilot, we'd track time to decision, avoidable follow-ups, unsafe approvals, and valid suppliers held by mistake. Thank you for your time. I'm Rafad, and this was our Zamp vendor onboarding walkthrough.
